

Project Report

on

Online Voting Survey and Election Opinion Analysis System

By

Udhayarajan J

Under the Guidance of

Monica Mali

Master of Computer Application

P.E. Society's

Modern Institute of Business Studies (Autonomous)

Pune

2025-2026

Progressive Education Society's
Modern Institute of Business Studies (Autonomous)

Certificate

This is to certify that the Mini Project (MMPRJ-2521) entitled **Online Voting Survey and Election Opinion Analysis System** is submitted by **Udhayarajan J** a bonafide student of this institute, studying for a Master of Computer Application, has successfully carried out MCA semester-II Mini Project. This project report is submitted in partial fulfilment of **M.C.A. Semester II Academic Year 2025-26** curriculum as per Institute norms.

Dr. Maithili Arjunwadkar
Director
PES MIBS

Project Guide

Internal Examiner

ACKNOWLEDGEMENT

It is my proud privilege to express my profound gratitude to the entire management of Progressive Education Society's Modern Institute of Business Studies (Autonomous) and Faculty members of the institute for providing me with the opportunity to avail the excellent facilities and infrastructure of the institute. The knowledge and values inculcated have proved to be of immense help to my career.

I am grateful to **Prof. Dr. Maithili Arjunwadkar (Director, MIBS)** for their astute guidance, constant encouragement and sincere support for this project work.

I express my sincere gratitude to Prof. **Monica Mali, MIBS** for their inspiration, constructive suggestion, mastermind analysis and affectionate guidance in my work, without which this project work completion would have been impossible for me. Sincere thanks to all my seniors and colleagues at the company for their support and assistance throughout the project.

I would like to thank all the faculties for providing me with an opportunity to pursue my industrial training, as it is an important part of the MCA course.

I feel proud and privileged in expressing my deep sense of gratitude to all those who have helped me in presenting this assignment. I would be failing in my endeavour if I do not place my acknowledgement.

Chapter 1 – INTRODUCTION

1.1 Introduction of project

The **Online Voting Survey and Election Opinion Analysis System** is a web-based application developed to provide a digital platform for collecting and analysing public opinions related to elections. In a democratic environment, understanding voter sentiment before elections is essential for decision-making, planning, and analysis. Traditional survey methods are often time-consuming, costly, and limited in reach, which creates a need for a more efficient and scalable solution. This project addresses these challenges by offering an online system that enables easy participation and real-time data analysis.

The system allows users to participate in election-related surveys through a **simple and user-friendly interface**, ensuring accessibility from any location. It also ensures **privacy and security** by allowing users to submit their opinions anonymously, encouraging honest and unbiased feedback. On the administrative side, the system provides features to **create, manage, and monitor surveys**, as well as analyse responses efficiently.

The application is developed using **Angular** for the frontend to provide a responsive and interactive user experience. The backend is built using **Python FastAPI**, which ensures fast, secure, and efficient handling of API requests. **MongoDB** is used as the database to store survey data due to its flexibility and scalability in handling large volumes of unstructured data.

The main purpose of this system is to support **data-driven decision-making** by analysing collected opinions and identifying trends in public sentiment. It helps researchers, analysts, and organizations gain insights into voter behaviour and predict possible election outcomes. Additionally, the project promotes **digital participation and transparency** in the electoral process.

Overall, the system provides a **reliable, scalable, and efficient solution** for conducting online surveys and analysing election opinions, forming a strong foundation for future enhancements such as advanced analytics and large-scale deployment.

1.2 Existing System and Need for System

Existing System:

The current system for collecting election opinions mainly relies on **traditional survey methods** such as offline questionnaires, face-to-face interviews, and basic online polls. These methods have several limitations:

- **Time-consuming process** for collecting and analysing data
- **Limited reach**, as participation is restricted to specific locations
- **High cost** involved in conducting surveys manually
- Lack of **real-time data analysis and reporting**
- Possibility of **data errors and inconsistencies**
- **Low user participation** due to inconvenience and lack of accessibility

Need for Proposed System:

To overcome the limitations of the existing system, there is a need for a **modern, digital, and scalable solution**. The Online Voting Survey and Election Opinion Analysis System is designed to fulfil this need.

- Provides an **online platform** for easy and wide participation
- Enables **real-time data collection and analysis**
- Reduces **manual effort, time, and cost**
- Ensures **data accuracy and efficient management**
- Supports **anonymous participation** for honest feedback
- Offers **analytical insights and visualization** for better decision-making

Thus, the proposed system improves the overall process by making it **faster, more reliable, and accessible**, while supporting **data-driven election analysis**.

1.2 Scope of Work

The **Online Voting Survey and Election Opinion Analysis System** is designed to provide a comprehensive platform for collecting, managing, and analysing public opinions related to elections. The scope of this project includes the development of a **web-based application** that ensures efficient survey handling, secure user participation, and meaningful data analysis.

In Scope:

- **User Management:** Registration, login, and role-based access for users and administrators
- **Survey Management:** Creation, modification, and management of election-related surveys and questions
- **Opinion Collection:** Users can submit their opinions **securely and anonymously**
- **Data Storage:** Efficient storage and retrieval of survey data using **MongoDB**
- **Admin Dashboard:** Monitoring survey participation, managing users, and viewing results
- **API Integration:** Backend services using **Python FastAPI** for handling requests and data processing
- **Data Analysis & Reporting:** Basic analysis of responses with **charts and visualizations**

Out of Scope (Future Enhancements):

- Integration with **advanced AI/ML models** for prediction
- Development of **mobile applications (Android/iOS)**
- Real-time live dashboards for opinion tracking
- Integration with **external or government election data sources**
- **Multi-language support** for broader accessibility

Overall, the system is designed to be **scalable, secure, and efficient**, providing a strong foundation for future enhancements in election opinion analysis.

1.3 Operating Environment - Hardware and Software

The system is developed and deployed in a **web-based environment**, requiring appropriate hardware and software to ensure smooth operation and performance.

Hardware Requirements:

- **Processor:** Intel Core i3 or equivalent
- **RAM:** Minimum 4 GB or above
- **Hard Disk:** Minimum 50 GB free space

Operating System Platform:

- **Windows 10 / Windows 11**
- **Ubuntu 22.04 LTS (Linux Environment)**

Software Requirements:

Frontend (Client Side):

- **Angular**
- **HTML5, CSS3, JavaScript, TypeScript**

Backend (Server Side):

- **Python 3.x**
- **FastAPI Framework**

Database:

- **MongoDB** (NoSQL database for scalable data storage)

Reporting & Visualization Tools:

- **Chart.js / Matplotlib** (for graphs and data analysis)

Development and Supporting Tools:

- **Visual Studio Code** – Code editor
- **Postman** – API testing
- **Git & GitHub** – Version control
- **Docker** – Containerization and deployment
- **Node.js & npm** – Package management for Angular

This operating environment ensures that the system is **efficient, scalable, and easy to develop and deploy**.

1.5 Detailed Description of Technology Used

The development of the **Online Voting Survey and Election Opinion Analysis System** involves a combination of modern web technologies that ensure **performance, scalability, and maintainability**. Each technology is selected based on its ability to handle specific system requirements effectively.

Frontend Technologies:

The user interface is developed using **Angular**, a powerful frontend framework that supports component-based architecture. It enables the creation of a **dynamic and responsive interface**, ensuring smooth user interaction. Technologies like **HTML5 and CSS3** are used to design the structure and layout of web pages, while **TypeScript and JavaScript** handle client-side logic, validations, and event handling.

Backend Technologies:

The backend is implemented using **Python FastAPI**, a high-performance web framework designed for building APIs. It supports **asynchronous programming**, allowing the system to handle multiple user requests efficiently. FastAPI also provides built-in features such as **data validation, security, and automatic API documentation**, which improve development speed and reliability.

Database Technology:

The system uses **MongoDB**, a NoSQL database that stores data in a flexible, document-oriented format (JSON-like). This allows easy handling of **dynamic survey data, user responses, and metadata**. MongoDB ensures **high scalability and fast data retrieval**, making it suitable for applications with large and varying datasets.

API Communication:

The communication between frontend and backend is handled through **RESTful APIs**. These APIs enable secure and structured data exchange, ensuring that user requests and responses are processed efficiently.

Data Visualization Tools:

To represent survey results effectively, tools like **Chart.js** or **Matplotlib** are used. These tools help generate **graphs, charts, and visual reports**, making it easier to understand trends and patterns in the collected data.

Development and Deployment Tools:

Development is carried out using **Visual Studio Code**, which provides an efficient coding environment. **Postman** is used for testing APIs, while **Git** and **GitHub** are used for version control and collaboration. **Docker** is utilized for containerization, ensuring consistent deployment across different environments. Additionally, **Node.js** and **npm** are used for managing Angular dependencies and packages.

Overall, these technologies work together to build a system that is **robust, scalable, secure, and capable of handling real-time survey operations efficiently**.

Chapter 2 – PROPOSED SYSTEMS

2.1 Module Design

The **Online Voting Survey and Election Opinion Analysis System** is structured using a modular design approach, where the system is divided into independent modules. Each module handles a specific functionality, ensuring **better organization, scalability, and maintainability**.

Modules of the System:

1. User Management Module:

This module manages all user-related activities. It handles **user registration, login, and authentication**. It also supports **role-based access control** for users and administrators, ensuring secure access to system features.

2. Survey Management Module:

This module allows administrators to **create, update, and manage surveys and questions**. It supports different types of questions and controls survey availability, ensuring proper management of survey activities.

3. Opinion Collection and Processing Module:

This module is responsible for **collecting user responses** submitted through surveys. It processes the data and stores it securely in the database for further analysis.

4. Analysis Module:

This module performs **data analysis on collected responses**. It identifies trends, calculates vote distribution, and helps in understanding public opinion patterns.

5. Reporting and Dashboard Module:

This module provides **visual representation of survey results** using charts and reports. It helps administrators monitor participation and interpret data effectively.

Overall, the modular design ensures that each component works **independently yet collaboratively**, improving system performance and allowing easy future enhancements.

2.2 Proposed System

The **Online Voting Survey and Election Opinion Analysis System** is designed as a modern web-based solution to overcome the limitations of traditional survey methods. The proposed system provides a **digital platform** that enables efficient collection, management, and analysis of public opinions related to elections.

The system allows users to participate in surveys through an **interactive and user-friendly interface**, making it easy to submit opinions from anywhere. It ensures **secure and anonymous participation**, which encourages honest feedback. The backend system processes user responses and stores them in a structured manner for further analysis.

Administrators are provided with functionalities to **create and manage surveys, monitor participation, and analyse results** through a centralized dashboard. The system uses **RESTful APIs** to handle communication between frontend and backend, ensuring smooth and efficient data flow.

The proposed system focuses on:

- **Automation** of survey and data collection processes
- **Real-time data handling and analysis**
- **Improved accessibility and participation**
- **Secure and scalable data management**

Overall, the proposed system offers a **reliable, efficient, and scalable solution** for election opinion analysis, enabling better insights and supporting data-driven decision-making.

2.3 Objectives of System

The **Online Voting Survey and Election Opinion Analysis System** is developed with the aim of providing an efficient and reliable platform for collecting and analysing election-related opinions. The main objectives of the system are:

- To design and develop a **web-based survey system** for collecting public opinions on elections
- To provide a **simple, user-friendly, and responsive interface** for easy participation
- To ensure **secure and anonymous submission** of user responses
- To enable administrators to **create, manage, and control surveys effectively**
- To store and manage data using a **scalable database system**
- To perform **analysis of collected data** and identify voting patterns and trends
- To generate **reports and visualizations** for better understanding of public sentiment
- To support **data-driven decision-making** in election analysis

These objectives ensure that the system is **efficient, secure, and capable of providing meaningful insights** from user opinions.

2.4 User Requirements

The **Online Voting Survey and Election Opinion Analysis System** is designed to meet the requirements of two main types of users: **General Users (Participants)** and **Administrators**. The system ensures ease of use, security, and efficient functionality for both roles.

General User Requirements:

- Ability to **register and login** into the system
- Access to **available surveys and questions**
- Option to **submit opinions or votes easily**
- Support for **anonymous participation** to maintain privacy
- Simple and **user-friendly interface** for smooth interaction
- Ability to view **basic survey information**

Administrator Requirements:

- Secure **admin login and authentication**
- Ability to **create, update, and delete surveys**
- Management of **survey questions and configurations**
- Access to **user responses and participation data**
- Dashboard to **monitor survey performance and results**
- Tools to **analyse data and generate reports**

System Requirements:

- Fast and **reliable system performance**
- Secure handling of **user data and responses**
- Support for **scalability and large data storage**
- Proper **API communication** between frontend and backend

These requirements ensure that the system is **functional, secure, and efficient**, meeting the needs of both users and administrators.

Chapter 3 – ANALYSIS AND DESIGN

3.1 System Flowchart

The system flowchart represents the **complete workflow** of the Online Voting Survey and Election Opinion Analysis System, including **Microsoft Entra (Azure AD) authentication using MSAL** for secure access.

Flow of the System:

- **Start**
- User opens the **web application (Angular UI)**
- **Authentication using MSAL (Microsoft Entra ID):**
 - User is redirected to **Microsoft Entra login**
 - User enters credentials
 - MSAL authenticates and returns **access token (JWT)**
 - If authentication fails → show error and retry
 - If successful → proceed
- **Role Identification:**
 - System identifies **User / Admin role** from token claims
- **User Flow:**
 - Access **User Dashboard**
 - View list of available surveys
 - Select survey and answer questions
 - Submit responses (optionally **anonymous**)
 - Data sent to backend via **secured REST API (token-based)**
 - Responses stored in **MongoDB**
- **Admin Flow:**
 - Access **Admin Dashboard**
 - Create, update, and delete surveys
 - Manage survey questions and settings
 - View user participation and responses

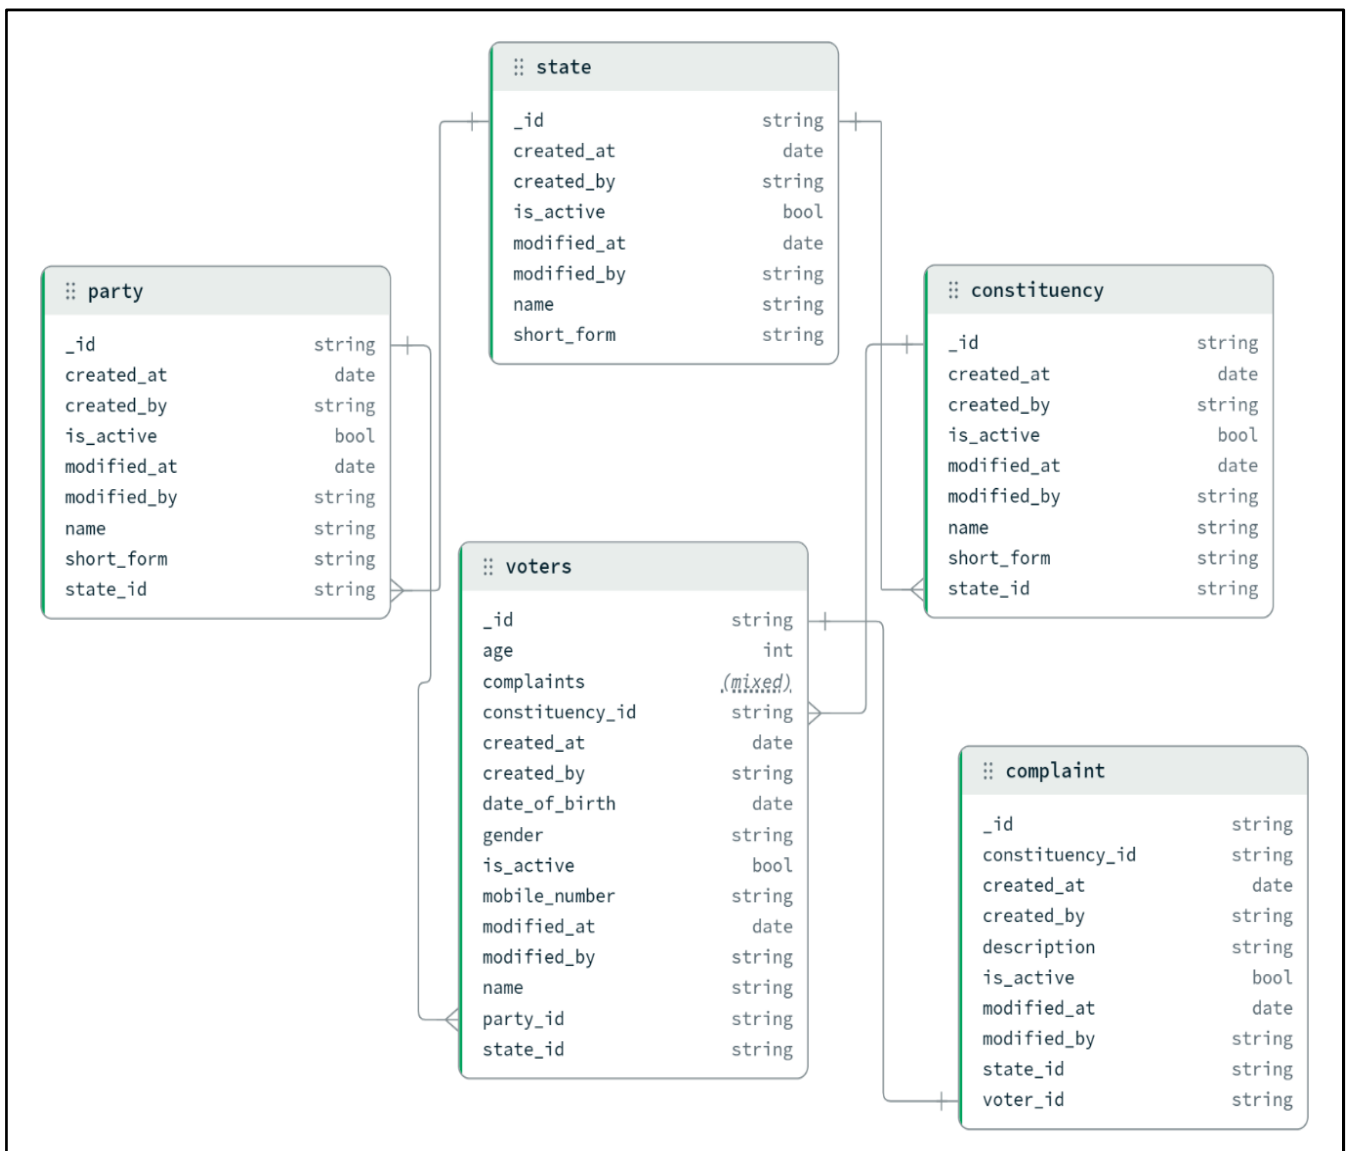

- **Backend Processing (FastAPI):**
 - Validate **JWT token from MSAL**
 - Process API requests
 - Store and retrieve data from database
- **Data Analysis & Reporting:**
 - Analyse responses (vote count, percentage, trends)
 - Generate **charts and reports**
- **Result Display:**
 - Admin views insights and analytics
- **End**

Key Points:

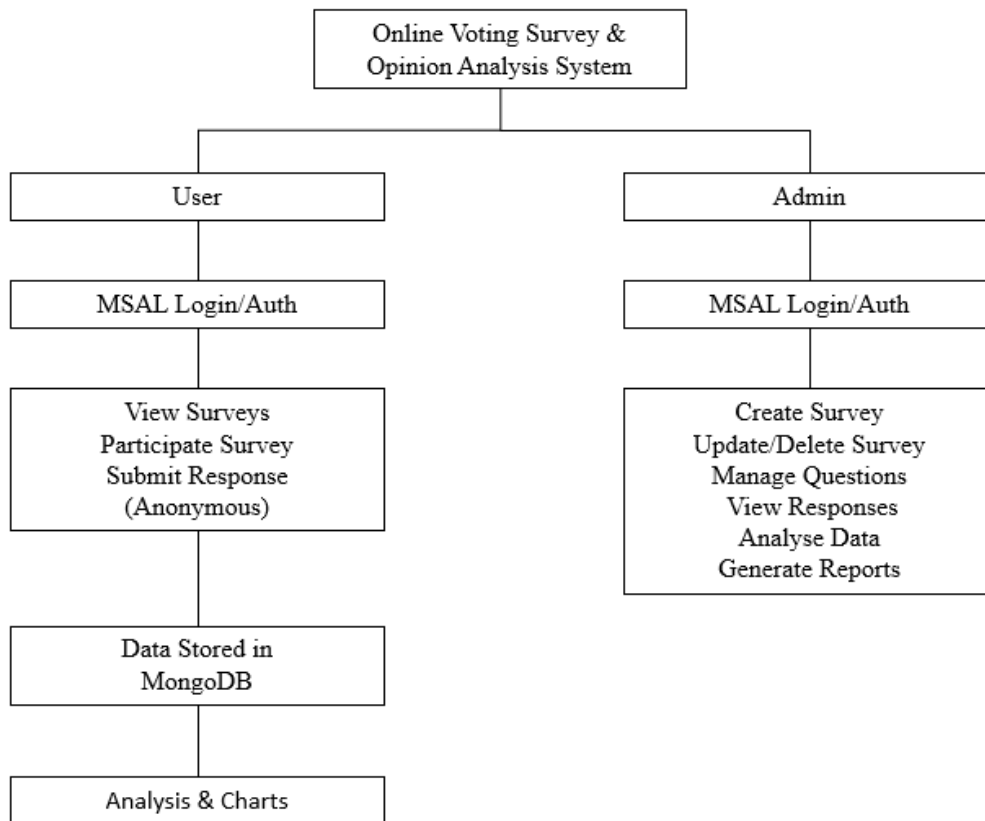

- **Secure authentication using Microsoft Entra + MSAL**
- **Token-based authorization (JWT validation)**
- **Role-based access control (User/Admin)**
- **Efficient data flow and processing**

This flow ensures the system is **secure, structured, and efficient** in handling user participation and data analysis.

3.2 Entity Relationship Diagram (ERD)

3.4 Use Case Diagram

The **Use Case Diagram** represents the interaction between **actors (User and Admin)** and the system functionalities. It shows how different users interact with the **Online Voting Survey and Election Opinion Analysis System**.

Actors:

- **User (Participant)**
- **Administrator (Admin)**

Use Cases for User:

- **Register / Login (via MSAL – Microsoft Entra authentication)**
- View available surveys
- Participate in surveys
- Submit responses (anonymous option)
- Logout

Use Cases for Admin:

- **Login (via MSAL authentication)**
- Create surveys
- Update/Delete surveys
- Manage survey questions
- View user responses
- Analyse survey data
- Generate reports and view dashboard

System Use Cases:

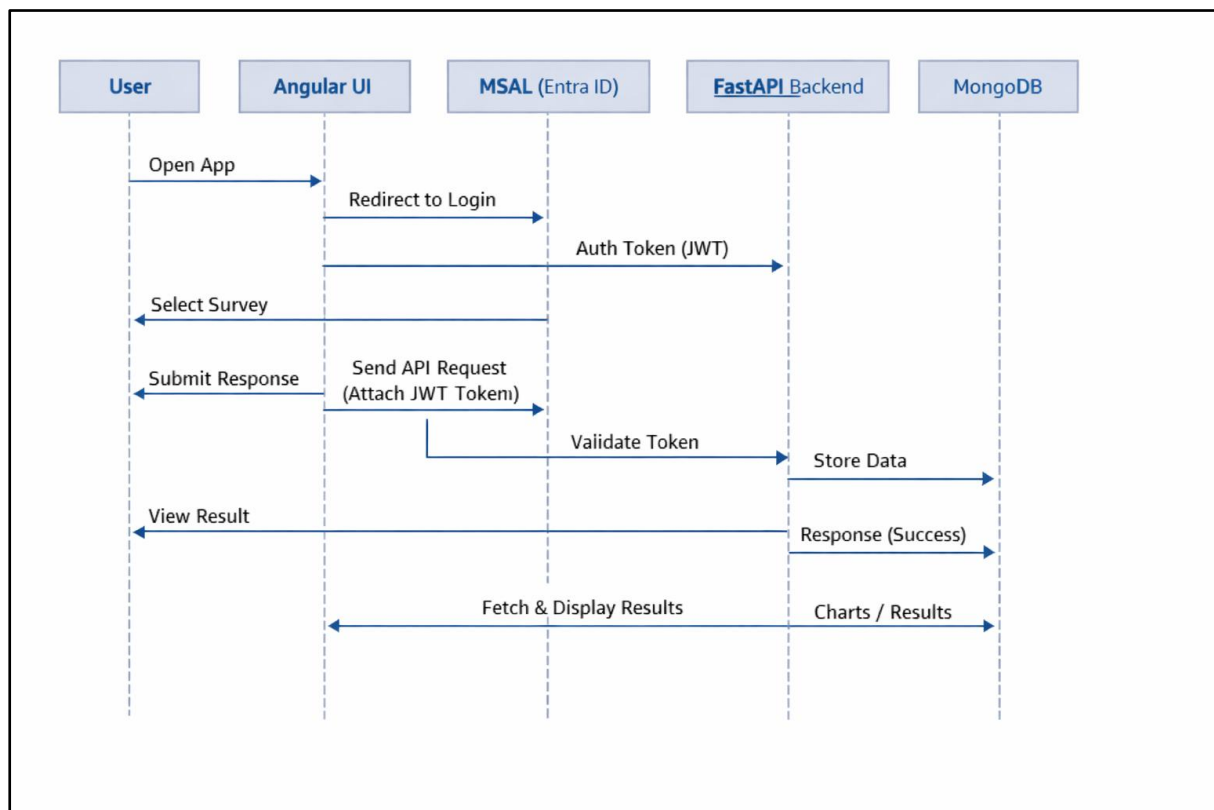

- Authenticate users using **MSAL (token-based authentication)**
- Validate user roles (**Admin/User**)
- Store and retrieve data from **MongoDB**
- Process survey responses
- Generate **analysis and visual reports**

Description:

The Use Case Diagram illustrates that users interact mainly with **survey participation features**, while administrators control the **management and analysis functionalities**. Authentication is handled securely through **Microsoft Entra with MSAL**, ensuring only authorized access to the system.

This design ensures **clear separation of roles, secure access, and efficient system interaction**.

3.5 Sequence Diagram

The sequence diagram illustrates the **interaction between different components** of the Online Voting Survey and Election Opinion Analysis System during execution. It shows how the **User**, **Angular UI**, **MSAL (Microsoft Entra ID)**, **FastAPI Backend**, and **MongoDB** communicate in a step-by-step process.

Initially, the user accesses the application through the web interface. The system redirects the user to **Microsoft Entra authentication using MSAL**, where the user enters valid credentials. After successful authentication, an **access token (JWT)** is generated and returned to the application. This token is used for **secure communication** with backend services.

Once authenticated, the user can view available surveys and submit responses. The Angular frontend sends the request to the backend API along with the **JWT token**. The FastAPI backend validates the token and processes the request. The submitted data is then stored in the **MongoDB database**.

For analysis, the backend retrieves stored data, processes it, and generates insights such as **vote counts, percentages, and trends**. The results are sent back to the frontend and displayed in the form of **charts and reports**.

Thus, the sequence diagram ensures a **clear understanding of data flow, secure authentication, and interaction between system components**, making the system efficient and reliable.

3.6 Activity Diagram

The activity diagram represents the **flow of activities and decision-making process** in the Online Voting Survey and Election Opinion Analysis System. It describes how users and the system interact from login to result analysis in a step-by-step workflow.

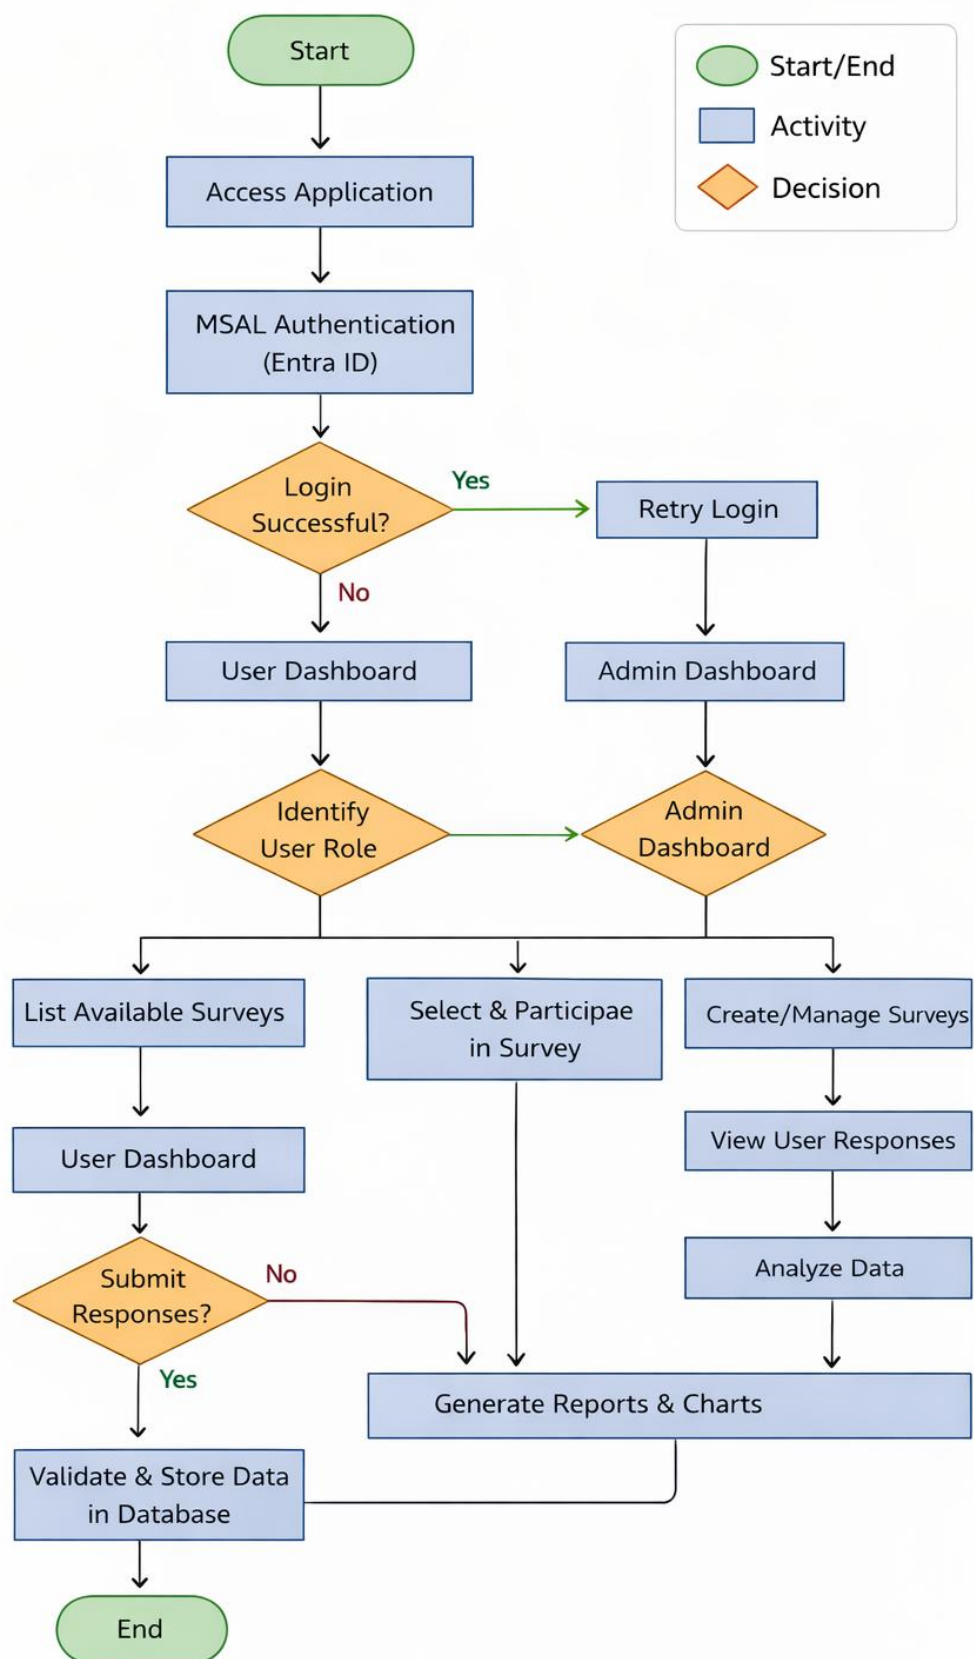

The process begins when the user accesses the application and is redirected for **authentication using Microsoft Entra (MSAL)**. After successful login, the system verifies the user role and grants access to the respective dashboard. If authentication fails, the user is prompted to retry.

Once logged in, a normal user can **view available surveys, select a survey, and submit responses**. The system validates the input and stores the data securely in the database. If the user chooses not to participate, the process ends.

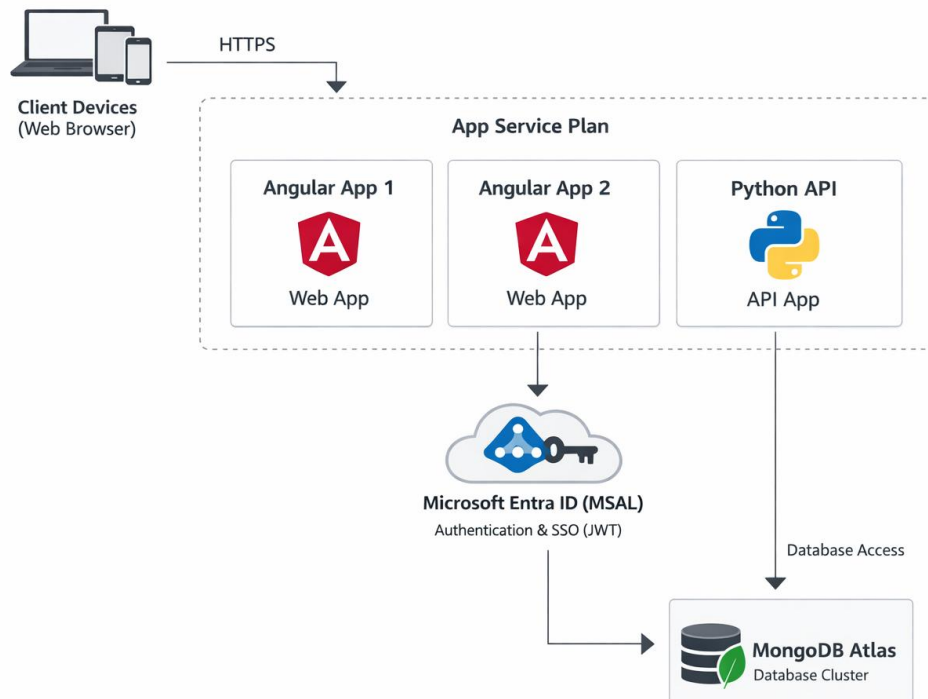

For administrators, after login, they can **create, update, or delete surveys, manage questions, and monitor user responses**. The system continuously processes the collected data and performs analysis.

Finally, the system generates **reports, charts, and insights**, which are displayed on the dashboard. The activity ends when the user or admin logs out of the system.

This diagram ensures a **clear representation of workflow, decision points, and parallel activities**, helping in understanding the system's overall functioning.

3.7 Deployment Diagram

The deployment diagram represents the **physical architecture of the system**, showing how different components are deployed across hardware and network environments. It illustrates the interaction between **client devices**, **web server**, **application server**, **authentication service**, and **database** in the Online Voting Survey and Election Opinion Analysis System.

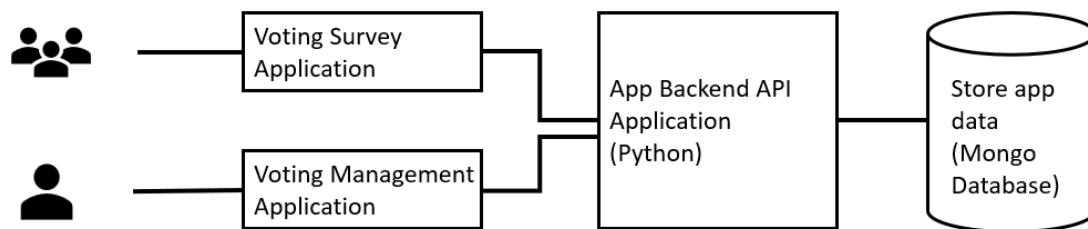

The system is accessed by users through a **client device (web browser)**. The frontend application developed using **Angular** is hosted on a web server and communicates with the backend through REST APIs. For authentication, the system integrates with **Microsoft Entra ID (MSAL)**, which handles secure login and token generation.

The backend is deployed on an **application server running Python FastAPI**, which processes user requests, validates tokens, and manages business logic. The backend interacts with the **MongoDB database server**, where all survey data, user responses, and system information are stored.

The communication between components is secured using **HTTP/HTTPS protocols and token-based authentication (JWT)**. This architecture ensures **scalability, security, and efficient system performance**.

3.8 Component Diagram

The component diagram represents the **logical structure of the system**, showing how different software components interact within the Online Voting Survey and Election Opinion Analysis System.

Components of the System:

- **Angular Frontend (Web Apps):** Provides user interface for **User and Admin**, handles user interactions, and sends requests to backend APIs.
- **MSAL Authentication Component (Microsoft Entra ID):** Manages **user authentication and authorization**, generates **JWT tokens**, and ensures secure access.
- **API Gateway / FastAPI Backend:** Handles all **business logic**, processes request, validates tokens, and communicates with the database.
- **Survey Management Component:** Manages **survey creation, update, deletion, and configuration**.
- **User Management Component:** Handles **user data, roles, and access control**.
- **Analysis Component:** Processes collected data to generate **insights, vote counts, and trends**.
- **Reporting Component:** Generates **charts, dashboards, and reports** for visualization.
- **MongoDB Atlas Database:** Stores **user data, survey details, and responses** in a scalable format.

3.10 Table Schema

The system uses **MongoDB (NoSQL database)** where data is organized into collections with defined schema validation and relationships. The following are the main collections and their structure:

1. State Collection: Stores details of states.

- **_id** (String) – Unique state ID
- **name** (String) – State name
- **short_form** (String) – Abbreviation
- **created_at, modified_at** (Date)
- **created_by, modified_by** (String)
- **is_active** (Boolean)

2. Constituency Collection: Stores constituency details linked to a state.

- **_id** (String) – Unique constituency ID
- **name, short_form** (String)
- **state_id** (String) – Reference to State
- **created_at, modified_at** (Date)
- **created_by, modified_by** (String)
- **is_active** (Boolean)

3. Party Collection: Stores political party details.

- **_id** (String) – Unique party ID
- **name, short_form** (String)
- **state_id** (String) – Reference to State
- **created_at, modified_at** (Date)
- **created_by, modified_by** (String)
- **is_active** (Boolean)

4. Voters Collection: Stores voter information.

- **_id** (String) – Unique voter ID
- **name, gender** (String)
- **age** (Integer)
- **date_of_birth** (Date)
- **mobile_number** (String)
- **state_id, constituency_id, party_id** (String) – References
- **complaints** (String/Null)
- **created_at, modified_at** (Date)
- **created_by, modified_by** (String)
- **is_active** (Boolean)

5. Complaint Collection: Stores complaints raised by voters.

- **_id** (String) – Unique complaint ID
- **description** (String)
- **voter_id** (String) – Reference to Voter
- **state_id, constituency_id** (String)
- **created_at, modified_at** (Date)
- **created_by, modified_by** (String)
- **is_active** (Boolean)

Chapter 4 – DRAWBACKS AND LIMITATIONS

The **Online Voting Survey and Election Opinion Analysis System** provides an efficient solution, but it also has certain limitations:

- **Dependence on Internet:** The system requires a stable internet connection, limiting access for users in low-connectivity areas.
- **Limited Prediction Accuracy:** The analysis is based on collected survey data, which may not always represent the entire population accurately.
- **No Advanced Analytics:** The system currently supports only **basic data analysis** and does not include advanced AI/ML-based prediction models.
- **Security Dependency:** Authentication relies on external services like **Microsoft Entra (MSAL)**; any service downtime may affect system access.
- **Data Bias:** Results may be influenced by **biased or limited user participation**, affecting the reliability of insights.
- **No Mobile Application:** The system is web-based and does not provide a dedicated mobile app for better accessibility.
- **Scalability Constraints:** Performance may be affected when handling **very large-scale data** without further optimization.

Overall, while the system is effective, these limitations highlight areas for **future improvement and enhancement**.

Chapter 5 – PROPOSED ENHANCEMENTS

The **Online Voting Survey and Election Opinion Analysis System** can be further improved by incorporating the following enhancements:

- **Integration of AI/ML Models:** Implement advanced analytics and machine learning techniques for **accurate prediction of election outcomes** and deeper sentiment analysis.
- **Mobile Application Support:** Develop **Android and iOS applications** to increase accessibility and user participation.
- **Real-Time Analytics Dashboard:** Provide **live dashboards** to track survey responses and trends in real time.
- **Multi-Language Support:** Add support for multiple languages to enable **wider user participation** across different regions.
- **Enhanced Security Features:** Implement additional security measures such as **multi-factor authentication (MFA)** and data encryption.
- **Integration with External Data Sources:** Connect with **government or public datasets** for more comprehensive analysis.
- **Scalability Improvements:** Optimize system architecture using **cloud scaling and load balancing** for handling large user traffic.
- **Advanced Reporting Features:** Provide **detailed reports, export options, and customizable analytics** for better insights.

These enhancements will make the system more **powerful, scalable, secure, and suitable for large-scale real-world applications.**

Chapter 6 – Conclusion

The Online Voting Survey and Election Opinion Analysis System successfully provides a web-based platform for collecting, managing, and analysing public opinions related to elections in an efficient and organized manner. The system addresses the limitations of traditional survey methods by enabling easy online participation, faster data collection, and improved accessibility for users.

The application ensures **secure authentication using Microsoft Entra (MSAL)** and supports **anonymous response submission**, which encourages users to provide honest and unbiased opinions. With the use of modern technologies such as **Angular, Python FastAPI, and MongoDB**, the system achieves **high performance, scalability, and flexibility** in handling large volumes of survey data.

The system also provides **administrative features** for managing surveys, monitoring participation, and analysing responses through dashboards and visual reports. These features help in identifying **voting trends, patterns, and public sentiment**, which are useful for researchers and decision-makers.

Although the system currently supports **basic analysis and reporting**, it establishes a strong foundation for further enhancements such as advanced analytics, real-time dashboards, and mobile support. Overall, the project meets its objectives by delivering a **reliable, secure, and user-friendly solution** that promotes digital participation and supports **data-driven election analysis**.

Bibliography

Chapter 7 – ANNEXURES

ANNEXURE 1: USER INTERFACE SCREENS

UI Screen Design: (Survey Application)

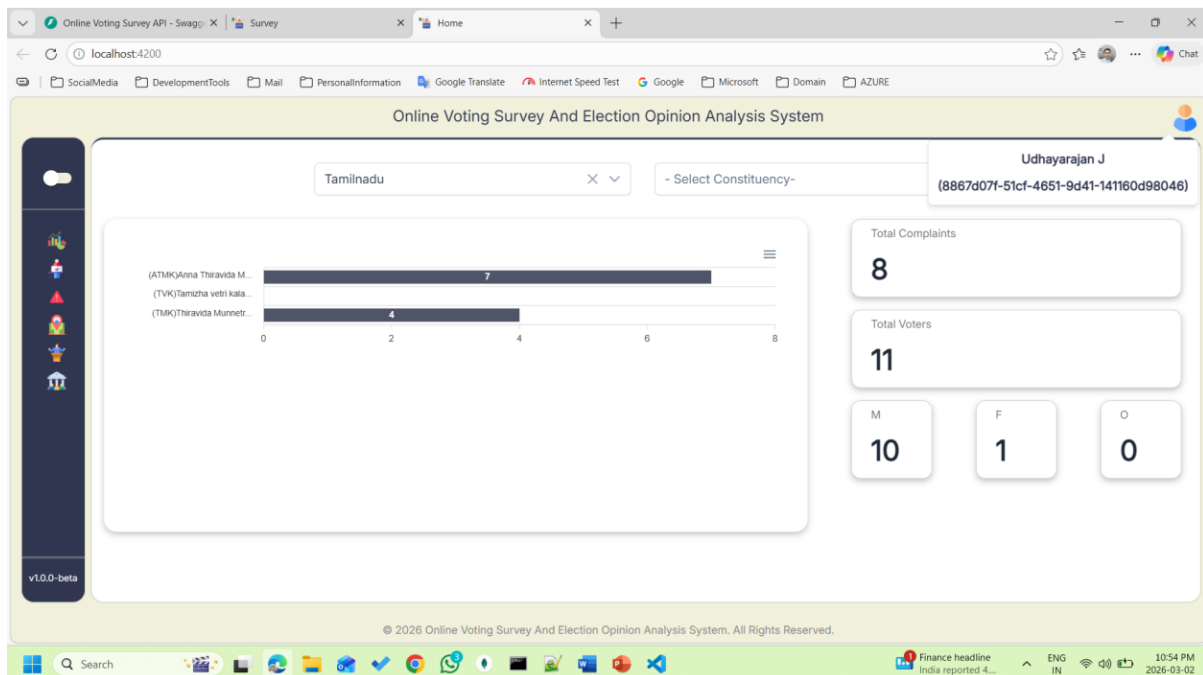

The screenshot displays the 'Online Voting Survey' web application running on a browser at localhost:4300. The interface is titled 'Online Voting Survey' and contains the following elements:

- Form Fields:**
 - * Name:** A text input field with the placeholder 'Enter the name'. A red border and error message 'Name is required (min 2 characters).' are visible.
 - * Mobile No.:** A text input field with the placeholder 'Enter the mobile number'.
 - * DOB.:** A date picker input field with the placeholder 'Enter the date of birth.' and a calendar icon.
 - * Gender:** A dropdown menu currently showing 'Male'.
 - Complaints:** A large text area for user input.
 - Use below as a next survey:** A toggle switch currently turned off.
 - * State:** A dropdown menu showing 'Tamilnadu'.
 - * Constituency:** A dropdown menu showing 'Aruppukottai'.
 - * Party:** A dropdown menu showing 'Anna Thiravida Munnetra Kalagam'.
- Buttons:** 'Save' and 'Cancel' buttons are located at the bottom right of the form.
- Footer:** A copyright notice '© 2026 Online Voting Survey. All Rights Reserved.' is centered at the bottom.

The browser's taskbar at the bottom shows the Windows Start menu, search bar, and various application icons. The system tray on the right indicates the date and time as 10:50 PM on 2026-03-02, along with weather and language settings.

UI Screen Design: (Management Application)

Dashboard

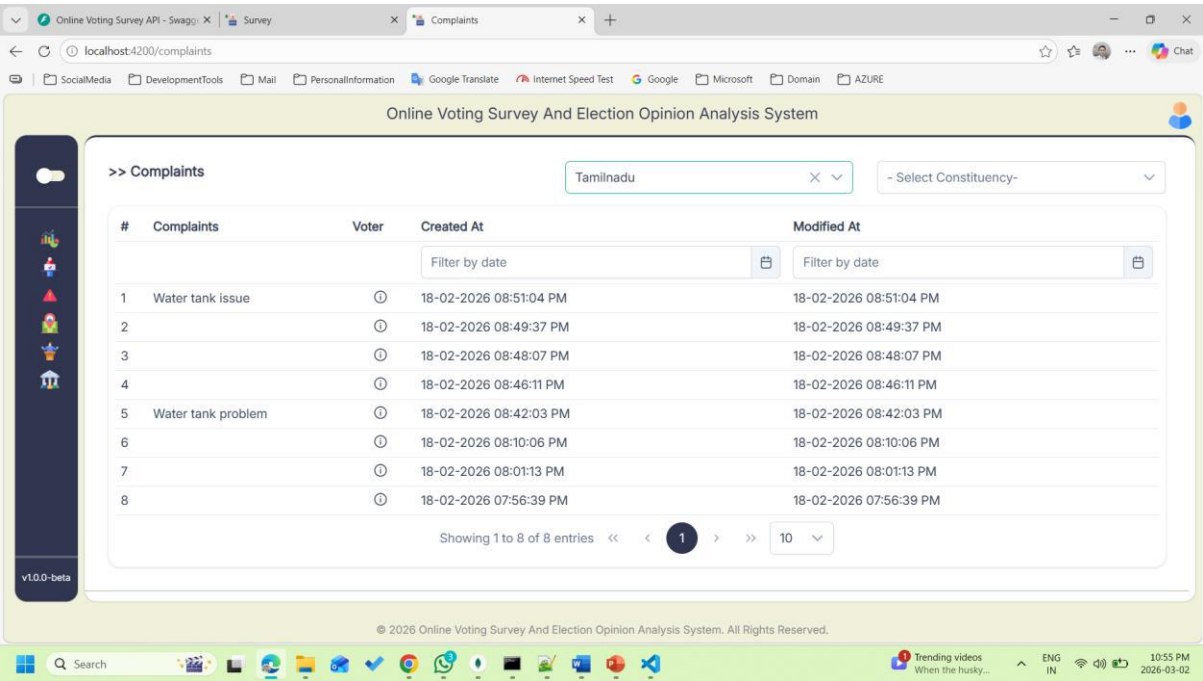

Voters Module

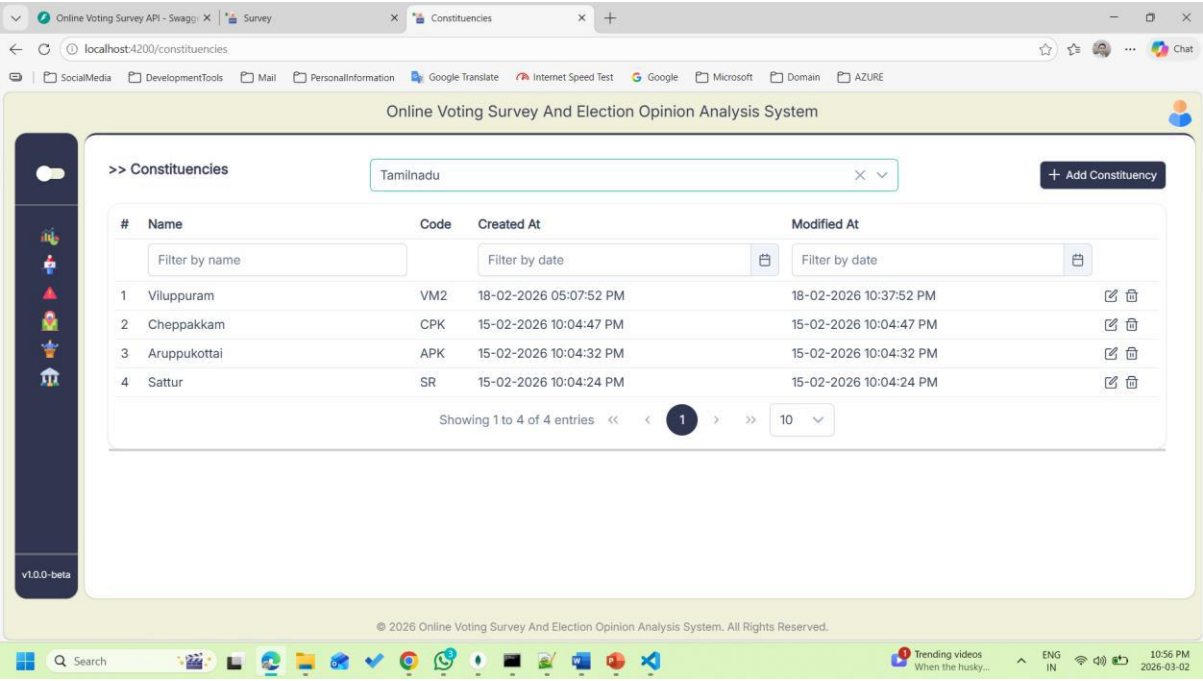

The Voters Module displays a list of voters with the following columns: #, Name, Mobile Number, Gender, Age, Complaints, Created At, and Modified At. The table is filtered by Tamilnadu and shows 9 voters.

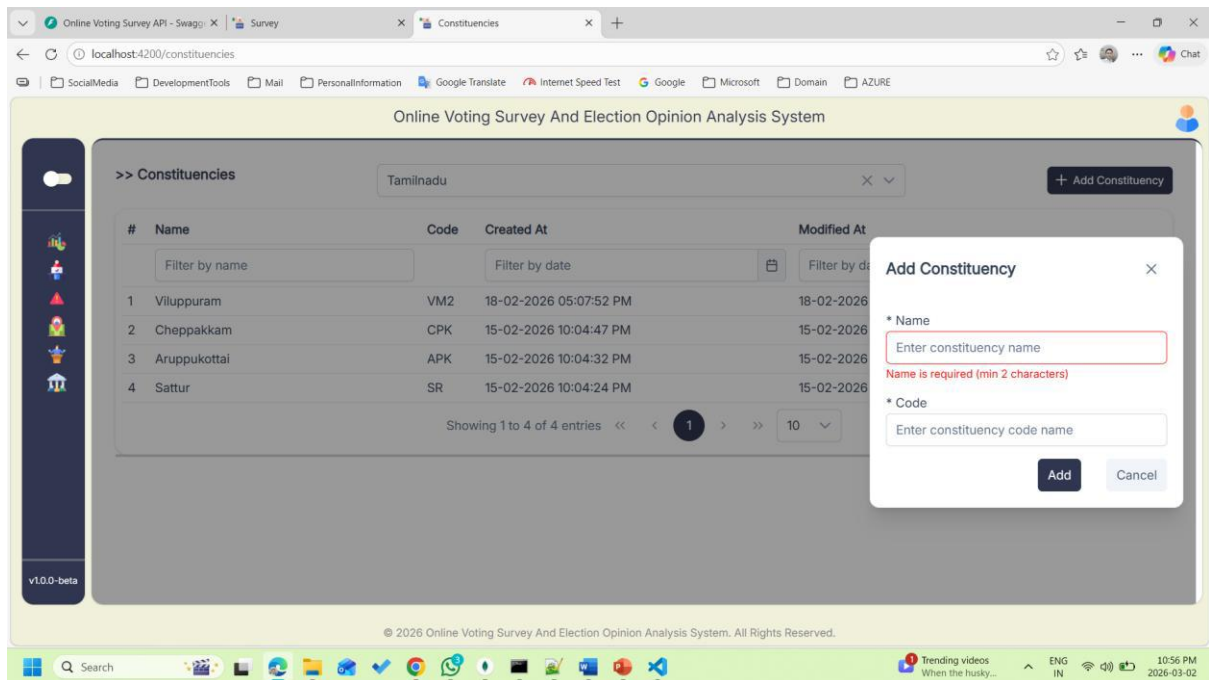

#	Name	Mobile Number	Gender	Age	Complaints	Created At	Modified At
1	Ravanan	7812312313	Male	29	1	18-02-2026 08:51:04 PM	18-02-2026 08:51:04 PM
2	OPS	7812312311	Male	28	-	18-02-2026 08:50:03 PM	18-02-2026 08:50:03 PM
3	IKJ	7878451156	Male	37	-	18-02-2026 08:49:37 PM	18-02-2026 08:49:37 PM
4	UJ	8588978979	Male	27	-	18-02-2026 08:48:07 PM	18-02-2026 08:48:07 PM
5	Arun	6454545545	Male	6	-	18-02-2026 08:46:11 PM	18-02-2026 08:46:11 PM
6	Abinaya	7304880702	Female	26	1	18-02-2026 08:42:03 PM	18-02-2026 08:42:03 PM
7	Udhayarajan j	8248748016	Male	0	-	18-02-2026 08:23:26 PM	18-02-2026 08:23:26 PM
